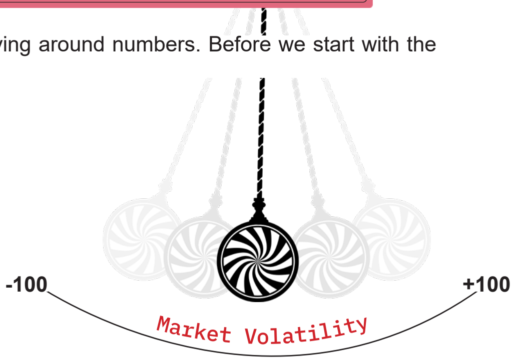
This is a conventional approach that everyone follows in the market. ***But, I have tweaked this strategy to make the most out of it. I call it the "unconventional weekly hedged calendar spread" strategy.*** The interesting fact is, I take Volatility Index into account while deploying this strategy.

CALENDAR SPREAD + INDIA VIX

The India VIX helps me get a range by playing around numbers. Before we start with the strategy, let's understand what India Vix is.

India Vix is a Volatility index for the Indian stock market. ***With the help of India Vix, a trader can get a sense of the either side movement range of the market.*** India Vix tells the percentage move of the market in a year. For example: The India Vix is at 13, which means, the market can move 13% from today in either direction.



In the above chart, you can see that the Nifty 50, according to India Vix, can travel to 13% on either side. The upside level for Nifty 50 is 20,680 and the downside level is 15,858.
