…37 years old, Mahesh Singhvi is the Head of Operations at a Chemical Company. He lives with his wife and son. Let us estimate his risk-taking ability. Most of his goals are important and not very flexible. So he gets a 0 for goals. Next, his expenses are 40% of income and his wife also earns, so he has less financial dependants. So, he gets a 1 based on expenses. Then, the majority of his goals need to be met in 15-20 years and are pretty flexible at the moment. So, we assign 1 based on time. After that, the majority of his assets are not very liquid and only 10% of his assets are in support assets. So, he gets a 0 based on assets. Lastly, his income is pretty stable but his income is 20% of assets currently. So we assign 0.5 based on income. In total we get, 0 (G) + 1 (E) +1 (T) +0 (A) +0.5 (I) = 2.5. Using the GETAI principle, we get a risk score of 2.5 which means moderate risk-taking ability…
