
Even when you trade based on price action, you think of buying when the price breaks the high of a candle near a crucial area and placing a stoploss at the low of the candle. However, an impulsive candle nearly covers a huge part of the primary move, and we are more prone to have a poor Risk to Reward ratio. A profitable trader is known for his asymmetric bets which give him most of the profits risking peanuts. On the other side, a trader with a poor Risk to Reward ratio eventually quits the market cursing different factors like price going against him, volatility, luck, etc. but impatience while trading.

IS THERE ANY 'RAM BAAN IJLAAJ' FOR THIS? WELL, NO, BUT YES!
