Conclusion

- Distribution is dynamic and ever-changing. If the products are subpar, the brand's image can be tarnished and distribution can become obsolete.
- If the benefits to wholesalers and retailers are not satisfactory, the distribution may cease to exist because now they'll not participate.
- If the product sales rise, then the distribution channels can increase manifold in a short period of time.

Large distributors take time to build. Once it is built, it can be a huge competitive edge for the company in the market. Companies generally disclose their distribution numbers.

4. Product Innovation

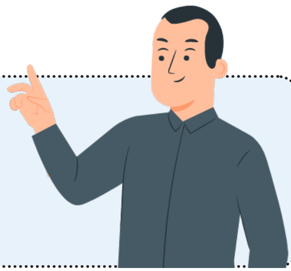
A company has developed a product that is

- **Unique**
- **Has no competition**
- **Provides value to its customers**
- **We can say, such innovative products have an edge in the market.**

For example,

Let us talk about Facebook. What are its various alternatives today? Which platforms allow us to connect with our friends? Instagram? It belongs to the same company. WhatsApp has a competitor called Telegram. However, we often circle back to WhatsApp as we are only able to find a few friends on telegram.

Since the services offered by Facebook are unique, others are unable to compete with them. These products have continued to innovate with their functionality. Therefore, as consumers, we do not have many options.



There are reasons as well, such as social effects, network effects, distribution, that led to facebook's growth, but the product at the core it has been innovative overtime. Facebook when it started was one of its kind. As a result, innovative products and companies stay ahead of the market. We want our company to have at least one edge- Brand, cost, Distribution, or Innovation.
