On the upside,

BREAK EVEN POINT = ₹5000 + ₹380

= **₹5380**

We hit break-even at ₹5380 and beyond this we start to make losses.

On the downside,

BREAK EVEN POINT = ₹6000 – ₹380

= **₹5620**

At ₹5620, again, we hit the break-even point and after this we start to make profits again. At ₹6000, our maximum profit is reached and beyond this we make a fixed profit only.

MAXIMUM LOSS = ₹500 – ₹380

= **₹120**

At ₹5500 point, we have our maximum loss. After that, our losses will decrease.

We can see that Long Call Butterfly and Short call butterfly are opposite sides of exact same trade. This means the payoffs for the two are exact opposite to each other.

Similarly, we can make payoff charts for Long Put and Short Put Butterfly strategy. Try doing that.
