TO SELL USING THIS STRATEGY, TAKE THE FOLLOWING STEPS:

- Open any charting software.
- Select the security you want to trade.
- Look for a downtrend and points where the bull run has exhausted. Why? Because a spot where the bull run has exhausted can turn into a reversal point for the price. The price can then pivot from there and fall giving us a good Risk to Reward ratio.
- Set 'Williams Fractal trailing Stoploss by SImpleCrypto'.
- Wait for the price to fall below the 50-day Simple Moving Average.
- Look for the fractal low to be broken.
- **SELL** when the price breaks the previous fractal low.
- Since we have tweaked the fractal range backwards from 2 to 4, we have a strong support that can be broken and the price can give move in the downward direction.
- The ideal place to put the **STOPLOSS** is the recent swing high or above the 50-day Simple Moving Average.
- The **TARGET** point is when the price takes support and reverses at any point.
- The ideal Risk to Reward ratio is 1:2.
