From a plethora of indicators, I have picked a combination of RSI and Volume Oscillator to create an intraday trading strategy.

- The use of the conventional approach of RSI and Volume Oscillator has worked wonder in the intraday segment.

- To make it simple, I would say RSI helps a trader in identifying overbought and oversold conditions with levels of 70 and 30 respectively. The Volume Oscillator helps a trader identify trends using a two-moving average system.

- A fast and a slow line of moving averages. I.e. when the fast moving average crosses the slow moving average from below, the Volume Oscillator turns positive and rises.

- Whereas, when the fast moving average crosses the slow moving average from above, the Volume Oscillator turns negative and falls.

I still remember one month prior to the Janta curfew (22nd March, 2020) announced by our respected Prime Minister, Mr. Narendra Modi. The market was moving upward but with less magnitude. The market was making higher lows but it seemed like the momentum was lost. To identify this, I used the Volume Oscillator and RSI daily. I journaled the synchronised movement of RSI and the Volume Oscillator and drew a conclusion, which is now one of my strategies mentioned in this book. I noticed that the Volume Oscillator oscillates between the range of -30% to 30% and the RSI oscillates between a range of 70-30.
