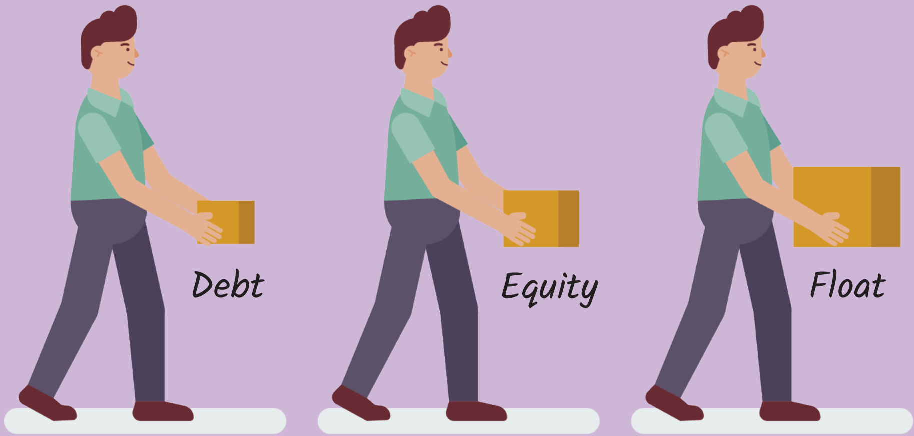
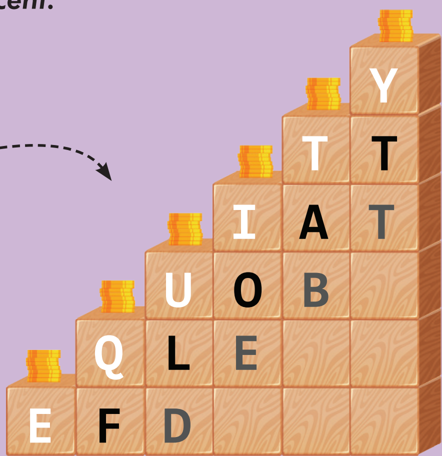
We can see that the company will want the largest chunk to be financed by float, followed by debt and equity.



In capital-intensive businesses, like businesses requiring a lot of machinery, debt is usually higher. Similarly, for a bank, debt will form a major chunk of the entire capital structure. Thus, we need to study which of the above three forms a higher chunk of the company's capital structure. We also need to understand the nature of the business.

For Pidilite, equity forms the largest chunk throughout the years, which stands at a minimum share of 66 percent.

Debt, as seen, forms a very low percentage of the capital structure. We can see that the company is primarily equity financed and does not depend too heavily on debt.



As a % of total Assets						
Equity	72.06%	75.39%	72.06%	73.63%	71.50%	66.04%
Float	21.83%	18.88%	22.38%	21.04%	19.40%	23.87%
Debt	6.12%	5.73%	5.57%	5.33%	9.10%	10.09%
