TO SELL USING THIS STRATEGY, TAKE THE FOLLOWING STEPS:

- Set the chart of any security on a 3-minute timeframe.
- Apply RSI, Parabolic SAR, and Heiken Ashi candlestick pattern.
- Wait for the candles to turn bearish and Parabolic SAR above the candlestick.
- With the above two confluences, wait for the RSI to move below the 50 level.
- Once all these confirmations hold true, the sell signal is triggered. **SELL** below the low of the bearish candle.
- Place **STOPLOSS** at the Parabolic SAR.
- **TARGET** is 1:2. If trading in multiple quantities, close half the position at 1:1.

In the above image, the Banknifty was moving sideways. It can be seen on the chart that the price came near its support making us alert for a breakdown. In this situation, we noticed that the RSI was falling below the 50 level, the candles turned bearish, and the Parabolic SAR was above the candles. Thus, all these confluences were confirming for a sell trade. At 1:48 p.m., we entered the trade. The target was hit around 3 p.m. We booked almost a profit of 1:3 Risk to Reward ratio.
