2 Buybacks and Equity Dilution Practices of the Company

We now proceed to the Buybacks and Equity Dilution Practices of the Company.

Buybacks and equity dilution practices of the company	

Here, we see from the above example the **company had one buyback**, and it is not diluting any of its equity shares beyond that.

With this, we have understood how the company finances its business. We will understand more about things like cost of debt, dividend etc. going ahead.

3 Overall Cash Flow within Company

We now move on to reading multiple years of cash flow statement and formulating a story of how the company's cash is moving. In order to do so, we need to look at CFI, CFO, and CFF together.

The company invests a part of it to meet its operating investments requirement. From a financing point of view, it is not dependent on external debt or equity. It regularly distributes dividends. The company did one major acquisition which used up a large part cash flow of the company.

As is clear from the data, the company maintains a balance where it undertakes a major investment in one year, and the next year it focuses on dividends and buybacks.

Looking at the above we can say that the overall cash flow for the company is quite healthy.
