

COMPANY	KEY TECHNOLOGY
Google	Search engine algorithm
Tesla	Electric vehicle technology and self-driven car technology
Adobe	Design software
Starlink	Satellite internet constellation

Prime examples of this are Google and Tesla. Google has spent years developing search engine algorithms. If today a company wants to start competing with Google in the search engine sphere, it will be a near-impossible feat. Even other giants like Facebook and Amazon will find it difficult despite their financial strength.

It is not only a matter of cost but also the amount of time required to develop a search engine that is as powerful as **Google**.

Competitors of **Google**, such as **Yahoo** and **Bing**, are not nearly as efficient or powerful in getting results. This is something that is reflected in numbers. You can observe this in the number of results, the quality of results, and the price people are willing to pay for an ad on Google versus an ad on Yahoo or Bing. The sheer volume of ads launched by Google will also be bigger than Yahoo and Bing.
