

Tesla, on the other hand, is a pioneer of electric cars and self-driven cars. Significant investments will be required to catch up to Tesla's expertise. They will have to invest a lot of time in mapping roads.

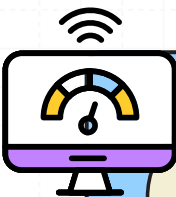

Then, they will need to build machine learning algorithms that can identify various things like other cars on the road, zebra crossings, signals, signs, barricades, and pedestrians. Then they will have to write an effective algorithm that can make route decisions and respond to any event that can happen on a road.

You must note that Google and Tesla do not have a competitive edge because their technology is impossible to replicate. Other companies could reach the levels Google and Tesla currently rest at, but by the time this happens Google and Tesla will be much further ahead.

In the design software space, Adobe is a market leader because of the advancements it has made by developing software such as Photoshop, Premier Pro, Illustrator, and After Effects. All of these are tools used by video editors, graphic designers, and various other creative professionals. No other company has been able to build products that can compete with Adobe.

Starlink is a company that provides high-speed internet almost anywhere on Earth. It has the capability of reaching the most remote locations. Its services are available across all continents. It provides its services through the world's first and largest satellite constellation using a low Earth orbit to deliver broadband internet services.
