

Option automation

Option automation aims to use algorithms and backtesting to improve consistency and efficiency. Some options automation approaches include delta drifting, delta hedging, IV spreads, and theta decay strategies.

Automation requires attention to factors such as ticket size, drawdown, maximum risk, and performance metrics, like the Sharpe ratio. You can learn more about automation to understand this new, technology-based trading technique.

You're now well-positioned to explore the possibilities of options trading. Continuous learning, upskilling, and caution will be mandatory in this journey. I wish you all the best in achieving success in this dynamic and exciting world!
