

Rough

Aquamarine crystals

Prismatic crystals | This outstanding mineral specimen displays numerous prismatic aquamarine crystals on a rock groundmass.

Aquamarine crystal | In general, beryl crystals of all colours tend to have fairly flat terminations, so the end faces on this crystal are unusually large.

Hexagonal outline

Goshenite crystal | This blocky, hexagonal goshenite crystal shows good clarity, a typically colourless interior, and a fine geometric form.

Red beryl crystal

Red beryl | Red beryl is scarce in cut stones, since its crystals are both rare and small. This crystal from Utah, USA, rests on a groundmass of rhyolite.

Well-formed planes

Morganite crystal | Morganite is the pink variety of beryl. Like the other beryls, it forms fine, well developed crystals such as this specimen.

Hexagonal face

Emerald crystal | This large and fine emerald crystal exhibits classic hexagonal form and emerald-green colour. It is approximately the size of a walnut.

Well-formed faces

Aquamarine crystal

Host rock

Classic crystal | Still retaining some of its host rock at the base, this gem-quality aquamarine crystal has a classic prismatic form, with flat end faces.

Gem-quality crystal

Heliodor | The yellow variety of beryl is called heliodor. The stunning clarity of this crystal is evidenced by its rock groundmass, which is clearly visible through it.
