

Jadeite RI 1.65–1.68
Jadeite varies in colour, and is white in its pure form. It has a moderate amount of dispersion.

Chrysocolla RI 1.46–1.57
Chrysocolla is generally blue-green and massive. Its fire and brilliance are moderately low.

Ruby RI 1.76–1.78
The best ruby material has excellent brilliance, as well as its striking red colouring.

Onyx RI 1.54–1.55
Onyx can be black or brown with white colour banding, giving a fairly restrained dispersion.

Sodalite RI 1.48
Transparent sodalite is rare, and its RI is low; however, good-quality gemstones can be cut.

Spessartine garnet
RI 1.79–1.81
Gem-quality spessartine crystals are rare, but have good dispersion.

Obsidian RI 1.45–1.55
Despite its deep black colouring, obsidian is more refractive than some gems.

Opal RI 1.37–1.52
Opal has a distinctive colour play, which comes from diffraction caused by tiny silica spheres.

Fluorite RI 1.43
With one of the widest colour ranges of any mineral, fluorite has moderate brilliance.
