

Giganotosaurus had a thick, strong neck to support its huge head.

Experts aren't exactly sure how big we were because not a lot of our fossils have been found.

A giant meal

The monstrous Giganotosaurus was so big and strong it could take on **huge prey** – even enormous sauropods such as Argentinosaurus. Giganotosaurus may have worked as a team to bring down these massive plant-eaters.

Argentinosaurus

Size: 12m (39ft) long

Habitat: Woodlands

Diet: Meat
