

We had a row of
bony **SPINES** all
the way along our
backs.

Musical marvel?

Corythosaurus' crest was hollow, and connected to its nose. This meant it may have worked a little like a **trumpet**, and could have been used to communicate with others.

It's likely that Corythosaurus ate fruit and pine needles as well as twigs, leaves, and seeds.

Size: 9m (30ft) long

Habitat: Forests

Diet: Leaves and seeds
