

What are fossils?

How do we know anything about dinosaurs and other prehistoric creatures if they're no longer around? We study their **fossils**.

A fossil can show us
if a dinosaur had
wings or feathers.

What are they?

Fossils are the remains of living things that died a long time ago and have **been preserved** in rock, mud, sand, or gravel.

If a dinosaur had sharp teeth and long claws, it was probably (but not always) a meat-eater.

Teeth

The bigger its bones, the bigger the dinosaur was.

Bone
