

Interesting teeth

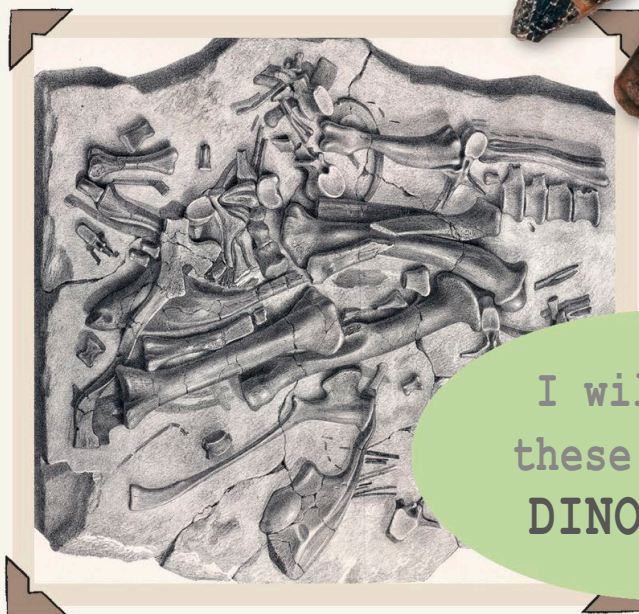

In 1820, **Gideon** and **Mary Ann Mantell** found tooth fossils that looked like an iguana's, but bigger. They named the newly discovered animal "Iguanodon".

Iguanodon
teeth

Other scientists thought the teeth belonged to a rhinoceros, but Mary and Gideon kept studying, and eventually found a full Iguanodon skeleton and one of a Hylaeosaurus.

I will name
these animals
DINOSAURS!

The dinosaur family

In 1842, **Sir Richard Owen** realized the fossils of Megalosaurus, Iguanodon, and Hylaeosaurus belonged a **group** of extinct animals – dinosaurs!

It was Sir Richard Owen who came up with the name dinosaurs. It means "terrible lizards".
