

Dinosaur eggs

Just like modern reptiles, dinosaurs **hatched from eggs**. Fossilized eggs can help us understand how young dinosaurs developed.

Some dinosaurs cared for their young after they hatched, but others were left to fend for themselves.

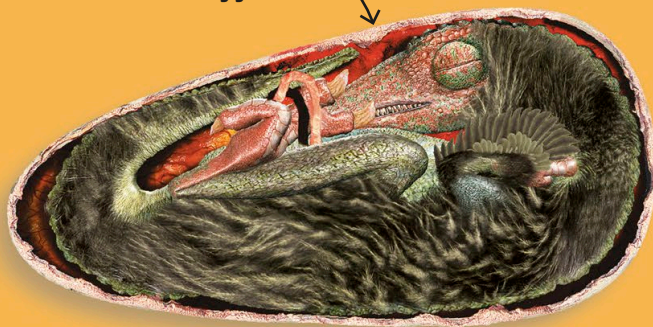

Nesting

Some dinosaurs, such as **Citipati**, built nests for their eggs and sat on them to keep them warm like many birds do today.

Small eggs, big dinosaurs

Dinosaur eggs varied in size and shape depending on the dinosaur, but they were all **relatively small** in comparison to a fully grown dinosaur. Experts believe this means dinosaurs probably grew to full size quickly.
