

Psittacosaurus

si-tak-ah-SORE-us

This little dinosaur was a relative of the massive horned Triceratops. They were part of the **ceratopsian** family.

We had small, spiky horns that stuck out from our faces.

Big beak

Psittacosaurus was named “parrot lizard” because of its bird-like **beak**. Although it also had teeth, its strong beak would have been useful to crack open seeds and nuts it found on the forest floor.
