

Scientists used to think our thumb spike was a face horn, a bit like a rhino's.

A group of 38 Iguanodon skeletons were found together in Belgium, so they may have lived in **HERDS**.

We were about as long as a *bus* and weighed as much as an elephant.

An early discovery

Iguanodon was the first plant-eating dinosaur ever discovered. It got its name because its teeth looked like they belonged to a giant **iguana**.

The thumb spike was about 14cm (6in) long.

Size: 9m (30ft) long

Habitat: Forests

Diet: Plants
