

## Happy family

Maiasaura dug nests in the ground for its eggs and covered the eggs with leaves to keep them warm. Once the eggs hatched, the babies **stayed in the nest** and were fed until they were strong enough to feed themselves.

Even after leaving the nest, young Maiasaura kept close to their mothers while they were growing up.

In 1985 astronauts took a Maiasaura fossil into space!

**Size:** 9m (30ft) long

**Habitat:** Plains

**Diet:** Plants
