

Excellent eyesight

Instead of having side-facing eyes like most dinosaurs, *Latenivenatrix*'s eyes **faced forward**. This helped it to judge distances when it hunted.

I had one of the biggest brains in relation to body size of any dinosaur (but it still wasn't very big!).

Natural nesters?

Adult *Latenivenatrix* fossils have been found on top of nests containing eggs. This means that *Latenivenatrix* probably **sat on its eggs** like many birds do today.

Strong, slender legs

Visible feathers

Size: 3m (10ft)

Habitat: Woodlands

Diet: Small animals
