

We have now broken down all the segment numbers into different parameters such as revenue, costs, and profits.

With that we have filled up the complete annual input sheet in the downloaded excel sheet. We will use these for our analytical purposes going ahead. These will all fall in place beautifully. Next, we go ahead and fill up the Annual Income Statement for the company in the Income Statement tab. We will fill up things like - Cost of Goods Sold, Depreciation, Amortization etc.

The sheet is so designed that the operating revenues and expenses are first followed by the non-operating revenues and expenses. Ultimately, we need to tally the EPS and PAT. These two should match at the final stage, even if they do not match at every level. Unless we've made changes in line items, Total Comprehensive Income should be the same.

In the next unit, we will fill up the remaining numbers in the income statement and balance sheet and then in cash flow. After that, we will start with the analytical part of the book where we will learn to analyze each and every line item.
