

In the manner we have been entering numbers for Cash flow from Investing, we will go ahead and enter numbers for all items in Cash flow from Financing Activities as we can see in the above table. Based on the above numbers, CFF for the two years are -

In this exact same manner we have to enter numbers for all the past years. With that we now have Cash flow from Operations, Cash flow from Investing and Cash flow from Financing Activities.

So if we put the annual inputs, income statement, balance sheet, and Cash flow together, this is exactly how you should input the raw data. Suppose there is any one-time item that is not to be repeated in the business. Those numbers can be directly eliminated.

Now in some places, the numbers might not be match. So you need to make sure that these numbers match by finding any linking errors or input errors, or maybe some value has been accounted for twice. It is fine if the numbers do not exactly match to the decimal point, but broadly they should match.

As we had discussed earlier, it will take time in getting used to such large numbers and high volume of data. But with practice and experience, you will become comfortable. Going ahead when we start using softwares to download numbers, we will skip a large chunk of what we have been doing so far. However, it is utmost important that we are familiar with how raw data is prepared. We will still have to normalize and categorize different line items.

With this we conclude our discussion of preparing raw data for further analysis. We will now move further to asking analytical questions to our data.

In the next chapter, we will focus on the analysis part. We will understand how the different numbers are performing and what they mean for the company and its operations. We will pick up each line item and understand their performance over the years. This will help us take different kinds of decisions about the company.
