

5.1

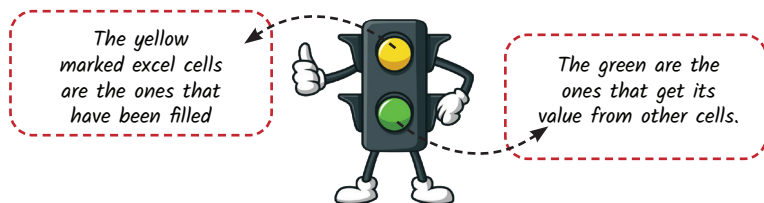

Introduction to Analysis

In the last chapter, we learned how to enter raw numbers and read Income Statements, Balance Sheet, and Cash Flow. As already discussed, you need to practice on as many companies as possible after entering the raw data. The main objective is to learn how to analyze the data for a particular company. Based on the data, we can make decisions regarding the company's performance, investment, debt-related decisions, etc.

We have been using case study of Pidilite Industries to understand the same. We will continue with the same. You must by now have a sheet that has past data filled for past years. The data is filled up in the Annual Inputs, Income Statement, Balance Sheet, etc. If you faced any problem in filling the past numbers you can download the filled excel sheet by scanning the QR Code beside. Check if you made any mistakes and rectify them.

Scan for the Filled
Template Sheet

We will be using all these to answer a lot of questions about the company and its performance. These include questions like -

How are the numbers performing against other competitors?

Where its profit is moving?

How is each business unit performing?

How are the margins changing over time?

How strong is the company's balance sheet?

How is the cash flowing in the company?
