We see that the operating assets bought are very high for **FY 2020**. The majority of investments are for purchase of fixed assets.

We find that in FY 2016, the company did not buy as much operating as the year before. In 2017 again, the company only invested 16.8% of its cash flow from operations in Operating Activities. This means a very large chunk was invested in Financial Assets in the year. We can have a look for each year about what part of investments were operating in nature and what part was Financing in nature.

We can look for trends and patterns about how the company makes its investments. Based on this behavior we can predict about the future investment decisions.
