

Here we need to see what share of Total assets is consumed by long-term Reverse Float. If this number is 30 percent, it means that 30 percent of the company's total assets like items gets no direct return. Though there might be operating profits, they do not generate direct returns.

Next, we move on to One time Recoverables. These are items that are not Reverse Float. The ratio that needs to be analyzed is One time Recoverable/Total Assets. Here we are only concerned about long term assets.

This tells us what part of Total assets is one-time recoverable. In many cases, these also earn a good rate of return. We need to understand how large they are and how and when will they be recovered?

Other Non-current Assets includes whatever is left out. Whatever we did not include in Reverse float like item as well as one time recoverables can be included here.

Other Non- Current Assets						
Reverse Float/ Total Assets	1%	1%	1%	1%	1%	0%
One time Recoverable						
One time Recoverable/ Total assets	1%	2%	2%	2%	1%	1%
Other Non- Current Assets						
Other non - current assets/ Total assets	0.26%	0.18%	0.11%	0.05%	0.06%	0.05%
Recoverability form/time and quality. Look for any past write-offs and provisioning						

We also need to look at Other Non-current Assets/Total Assets. If this number is too big, then we need to understand what comprises the Other Non-current Assets. Here the Non-current assets is not large and stands at 2-3 percent. We must keep a track on how it is changing and reasons behind the same.
