

FILLING UP THE EXCEL SHEET

The next step is to open an empty Excel sheet and start filling it up slowly. Every business has its own financial model. You can look at templates for reference but then start from scratch. Starting from scratch will help you paint a realistic picture about your business.

Ideally, create financial propositions for 12 to 18 months.

Next, you need to identify KPIs relevant to your business and forecast them. From these forecasts you need to derive reference of the company.

You need to add expenses like the cost of goods, Customer acquisition cost, Employee costs, logistics expenses, and office overheads.

This way, you can add as many line items as you have. You can also break an item into different parts.

For example:

Office overhead can be divided into rent and other expenses.

On the other hand, you can divide employee expenses into employee salaries and other employee expenses like hiring costs.
