

2. ASSETS NEEDED FOR THE REVENUE

Let's assume that using KPIs, you forecast a certain revenue. Now you have to focus on the assets required to generate that revenue

For example, if your business is about manufacturing or production, you will need manufacturing facilities as you grow. These assets must also be accounted for as they will require capital. Apart from funding the expenses, the investors will also be funding the assets.

So be very clear about the assets you require for your business. In the Excel sheet, you can create a detailed asset chart to help the investors get more clarity around the required assets.
