

For example:

Say you run a social media platform with:

USERS

→ 10K

RECENT DEAL

→ 10\$
PER USER

You can simply multiply the users by the valuation offered in recent you should value yourself as :

$$10,000 \times 10\$ = 100,000\$$$

You can even use forecasts or forward looking numbers to value your business. Say, you expect to have 30k users in next 3 months.

USERS

→ 30K

RECENT DEAL

→ 10\$
PER USER

Valuation as per forward looking numbers 3 months from now:

$$30,000 \times 10\$ = 300,000\$$$

Now it depends on negotiations and other business factors that determine if you are a good candidate for investment.
