

You therefore need to reverse calculate the current valuation based on expected exit valuation. With this, today's valuation will come down to:

$$50 \text{ CRORES} / 10X \text{ RETURNS} = 5 \text{ CRORES}$$

In this method, you will not be using today's numbers.

2022

but a number two years down and then revenue calculate today's numbers.

2024

Here the most important factor is the investor's comfort and confidence that you will be able to grow to the future number d.
