

Timespan

Demand forecasting and analysis can be done for the short, medium, and long terms.

Time Span	Period	Evaluation
Short Term	3-12 months	Year-specific and seasonal demand for the product. Seasonality must be carefully evaluated, as it is a recurring phenomenon.
Medium Term	12-36 months	The demand against the capacity in the industry and where the industry is placed cyclically. This helps evaluate the cyclicity of the industry's profitability.
Long Term	More than 36 months	Focuses more on the survival of the industry, its evolution, and the effects of disruption.^[9] This is more structural, as, in the long run, the effects of seasonality and cyclicity are neutralized.

Scope of Market

QSR Industry

Macro-level demand forecasting focuses more on the demand from consumers at the macro level, which means at the level of the economy or the industry.

Business

Business-level demand forecasting focuses on firm-specific demand, based on factors such as product category, sales division, and financial division.
