

Not all products need to go through all the stages; some fail at the initial stage, while others may reach the decline stage directly, skipping the maturity stage. Also, when an industry moves from one stage to another, the transition occurs over a period of time.

The life cycle of an industry depends on various factors:

- Rate of technological change
- Rate of market acceptance
- Competitor's entry
- Economic and managerial forces
- Risk-bearing capacity
- Government policy^[19]

Even within the same industry, various firms may be at different life cycle stages. This is because some firms can find new uses for their declining products, thus extending their life cycle. Firms have varying abilities to prolong their life cycle based on their strategic choices.^[20]

Some of the common strategies to extend product life cycle are:

- Product modification
- Entry into a new market
- Promoting frequent use
- Developing different usage
- Use of aggressive advertising and sales promotion techniques^[19]

So, as an entrepreneur or analyst, we need to understand what phase is the industry currently in and what can we do to benefit from the same or change the life cycle.
