

The idea of this book as already mentioned is to provide an exhaustive and most importantly, an 'implementable' guide for those in the investing industry or are looking to get into it. The focus of the work at each step has been to make the work as exhaustive as possible and as applicable as possible. This, however, was not possible by ignoring the wonderful work done by others in the field in the past. Many ideas discussed in the book that make sure the process and 'Industry Sheet' is exhaustive have been either borrowed or inspired by past works in the field. We did not feel fit to leave out such amazing work, as it would have defied the entire purpose – Exhaustivity and Applicability for the reader. We have taken these ideas sitting in rich libraries and tried making them more applicable for the reader. The inclusion of these ideas make sure that now the 'Industry Sheets' is exhaustive and applicable. Here, we include a list of sources.

- **Value Proposition Model** – Has been inspired by the book Value Proposition Design by Alex Osterwalder and his team. We do not completely agree with the customer profile side of their model and have made changes accordingly in ours.
- **Value Chain** – It was first introduced in the book Competitive Advantage by Michael E. Porter.
- **Industry Map** – It was first discussed by Michael Mauboussin.
- **Profit Pool** – First introduced by two researchers at Bain & Co.
- **Five Forces model** – This iconic piece of work was introduced in the book Competitive Strategy by Michael E. Porter.

In no way do we claim these to be my pieces of work. We have mentioned all the sources in the text, wherever it is applicable. These have been a result of countless hours of effort put in by the researchers and their team, and they are the ones who deserve complete credit for it. We would also insist that the reader checks out the researchers' complete work as well.
