

Severity

All pains and gains are not equally important. Some pains may be more important and pressing (to be relieved) than others for particular customer segment. Some pains may be less important or urgent.

Also, different customer segments may be willing to pay different amounts for the same gain, as each gain is perceived differently. Hence, each pain, gain, and risk needs to be prioritized based on its severity and relevance to the customer group.

Each pain and gain should be identified in terms of the severity with which it affects the customer.

The performance of the car heater may not be as important in western India as it is for the customers of Northern India.

The quality of the camera in a phone is more important to photographers than to others.

When trying to understand the severity, the entrepreneur/investor needs to look in as much depth as possible, and talk facts and numbers.

For example, when a customer gives feedback on any app mentioning that it becomes boring after a point, the app developer must try to look in depth and understand after how many minutes does it become boring for the customer? And why?

Objectivity is essential in understanding the relative differences between the severity of various gains, pains, and risks.
