

The features of the products and services can be segregated as pain relievers and gain creators. The features that relieve the customers of their pain is a pain reliever whereas those that create benefits for them are gain creators. This too was first discussed in the book - Value Proposition Design.

an easy interface
in a mobile
application would
be a pain reliever.

an easy interface
in a food home
delivery service of
that app would be
a gain creator.

Pain relievers and gain creators of the product must be designed to suit the profile of the customers.

Pain Relievers

Pain relievers are the features of the product or service that relieve the customer of the pains that they were experiencing. They focus on reducing any discomfort that the customer may have.

**Unhygienic Food, Poor Nutrition
Value, Adulteration, Slow Service**

So, products should initially focus on the most severe pains and then, over time, add features that cater to the other pains of the customer.

The importance and relevance of the pain reliever depend on the severity of the pain. A pain reliever that releases a customer of a pain that is not very high on priority is not likely to create a lot of value for the customer.
