

Industry Map

Michael J. Mauboussin and Dan Callahan identified the concept of an industry map in their ground-breaking paper 'Measuring the Moat'. They identify it as a visual representation of all players in an industry—suppliers, manufacturers, distributors, consultants, influencers, regulators, dealers, and customers, and how money, products, and services change hands within the industry.

The goal of an industry map is as follows:

Identify the kind of economic relationship that the industry has with all support industries and institutions.

It helps understand the different suppliers and customers and the bargaining power that each party has. It explains the dependent industries
