

One of the simple, yet powerful risk management models is the Robson risk management model. Created by Dr. Linda M. Robson, the model was first created to identify and control industry-specific risks affecting the events industry.

## The First Step - Personal Risk Perception.

It focuses on the identification of any activity within the industry that is perceived to increase the uncertainty of outcome. Different activities can be perceived with varying levels of risk by different people. **Activities that are perceived to be partially risky should be identified. Identify as many potential risks as possible.**

This task involves creating a list of activities and factors that may or may not be risky in reality but is perceived to be risky. The source of information can be primary as well as secondary.

Entrepreneurs, business managers and analysts may collect data from various sources like **industry publications, commentaries by various management experts, journals, or government statistics.** They can also rely on first-hand experience within the industry.<sup>[7]</sup>
