Elon Musk to be summoned by UK govt over X's alleged role in riots and hate speech

Elon Musk

The UK government is set to summon Elon Musk to testify about his social media platform, X, as part of a parlia-

mentary inquiry into its alleged role in spreading disinformation.

The inquiry, led by the Commons science and technology select committee, will examine the impact of social media and artificial intelligence (AI) on recent riots and the spread of harmful content online.

Senior executives from Meta, which owns Facebook and Instagram, and TikTok are also expected to face questioning, reports The Guardian. The hearings are scheduled to begin early next year. Lawmakers aim to address concerns that the UK's online safety laws are struggling to keep up with rapidly advancing technology and the role platforms like X play in misinformation.

One key focus will be the consequences of generative AI, which was used to create and share false images on X and Facebook.

These images encouraged Islamophobic protests following the tragic killing of three schoolgirls in Southport in August. MPs will also investigate how social media business models may contribute to spreading harmful or misleading content.

Accident or cover-up? OpenAI allegedly deletes potential evidence in copyright case

OpenAI is facing new accusations from The New York Times and Daily News, who are suing the company for allegedly using their copyrighted content to train its AI models without consent. In a recent turn of events, the publishers' lawyers have claimed that OpenAI engineers accidentally deleted critical data that could have played a key role in their legal battle.

According to the publishers' legal team, OpenAI engineers accidentally deleted important data that could have helped in the ongoing lawsuit. This data was stored on a virtual machine — a software-based computer system set up specifically for the case — that OpenAI provided to the plaintiffs to search for their content in its AI training sets. Since November 1, the publishers' lawyers and experts have spent over 150 hours combing through OpenAI's training data. <https://bit.ly/3Zp60pm>

Indian-origin CEO wants his employees work 14 hours a day

After Narayan Murthy, another Indian-origin CEO publicly promoted intense work culture, Daksh Gupta, who is the CEO of San Francisco-based AI startup Greptile took to social media to share that his employees face 84-hour work weeks with very little work-life balance. This created a controversy online, with many criticising his thoughts.

Gupta took to his social media to share Greptile's schedule, he said, "Workdays start at 9 a.m. and end at 11 p.m., often later, including Saturdays and sometimes Sundays." He acknowledged the fact that this does not work for everyone and hence they share it clearly with potential hires. The tweet was viewed over 1.6 million times and sparked intense debate online. Twitter users were quick to criticise Gupta and accused him of exploiting workers. <https://bit.ly/3ZbGqV4>
