Apple plans to revolutionise Siri with Conversational AI by 2026

Siri will be more powerful than the one coming now with Apple Intelligence. It can debut as early as 2026. It will

have capabilities such as text writing, summarisation, and improved third-party app interactions through expanded use of App Intents. The better Siri will analyse on-screen data and user behaviour to better execute commands. Apple has also hinted at its focus on privacy. Apple plans to integrate the system into iOS 19 and macOS 16. <https://bit.ly/3Zn3d1y>

Xiaomi working on RayBan Meta-like AI glasses

According to recent media reports, Xiaomi is currently working on a pair of AI-powered glasses. These can look and work like the popular

RayBan Meta glasses. For this, Xiaomi is reportedly collaborating with Apple's supplier Goertek. As revealed by a report from IT Home, Xiaomi's smart glasses will feature both camera and audio capabilities. It can also support AI functions. With the design, it can closely resemble the other glasses that we've seen on Meta, Snapchat, and all. <https://bit.ly/4g3LGkE>

Tough times ahead for AI chatbot developers

Google, OpenAI and Anthropic are running out of content to train advanced AI models

—By Ayushi Jain

Big tech firms like Google, OpenAI, and Anthropic, known for pioneering AI technology, are facing serious challenges as they try to develop the next generation of AI. According to sources, these companies are struggling to make breakthroughs with new AI models, citing a critical lack of fresh,

high-quality data to train them effectively. For example, OpenAI recently aimed to push boundaries with a new model, code-named "Orion," but early tests suggest it doesn't surpass existing models like GPT-4 or GPT-3.5. Reports indicate Orion failed at certain tasks, particularly coding challenges that were outside its training. Similar issues are affecting Google and Anthropic's models. Google's

latest Gemini AI hasn't met internal performance goals, while Anthropic delayed releasing its anticipated Claude 3.5 Opus model, hinting at similar setbacks. One major hurdle these companies face is the lack of new, valuable data, reports Bloomberg (via Windows Central). Generative AI models like ChatGPT rely heavily on internet content for training. However, they're reaching a limit, especially as publishers and authors raise concerns about AI using their content without permission or compensation. Microsoft and OpenAI are even battling copyright infringement cases, with OpenAI's CEO, Sam Altman, acknowledging that creating models without copyrighted material is nearly impossible. <https://bit.ly/4eNcKmU>
