

Tiny robot kidnapped bigger robots from showroom

In a strange incident, a robot named Erbai kidnapped 12 bigger robots from a showroom in China. The event was recorded on CCTV camera and the footage has now gone viral on social media. In the video, you can clearly see how the tiny robot is leading the other robots out. The tiny robot, developed by a Hangzhou-based company, engaged in an eerie, human-like conversation with the showroom robots. To this, one larger robot cribbed about its endless work schedule and said, "I never get off work." <https://bit.ly/413YK57>

Former Google CEO warns about unprecedented AI growth

Former Google CEO Eric Schmidt shared his perspective on the future of AI development in a post highlighted by @tsarnick on X.

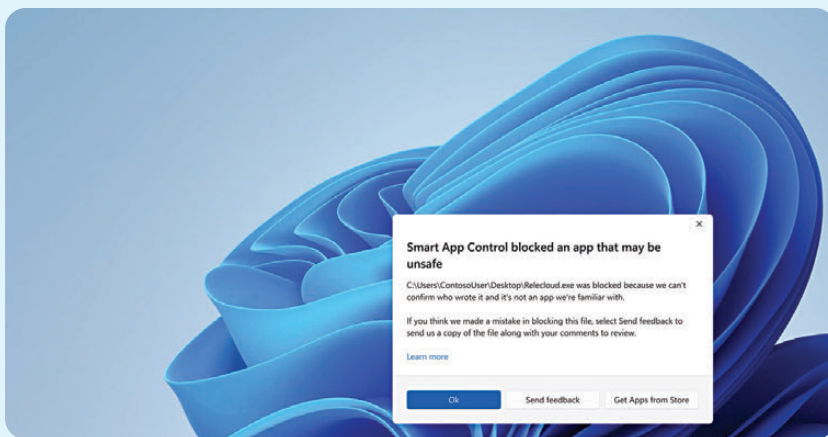

Schmidt stated, "In 5 years, you'll have two or three more turns of the crank in these large models. These large models are scaling with an ability that is unprecedented. Schmidt remains confident that AI will continue to improve, with advancements likely to be seen in areas such as physics and mathematics. However, Schmidt also issued a cautionary warning about the risks that could accompany these advancements. <https://bit.ly/3YYqcP6>

AI on Windows PC: What's changing?

Microsoft's Anand Jethalia talks about AI and securing the future of Windows operating systems

—By **Jayesh Shinde**

Generative AI is reshaping industries at an unprecedented pace, we all can attest to this phenomenon. Which is why cybersecurity matters more than ever before. As Windows continues to incorporate AI-driven features, from intelligent security protocols to enhanced user functionalities, the operating system is redefining what personal computing means for all of us. To understand how AI is transforming Windows and its implications for cybersecurity, I interviewed Anand Jethalia, Country Head of Cybersecurity at Microsoft India & South Asia. Our conversation delved into the escalating role of AI in both fortifying and challenging Windows security. With cyber threats growing in sophistication, AI emerges as a double-edged sword – empowering defenders while equipping adversaries alike. Anand shares insights

on how Microsoft leverages AI to protect Windows users globally, the innovations on the horizon, and how individuals can navigate this new era where AI and Windows converge to shape the future of personal and enterprise security. Edited excerpts follow:

Q) How is AI changing the way we protect ourselves on phones and laptops?

AI is truly transforming how we protect personal devices, like phones and laptops, from cyberthreats. At Microsoft, we're leveraging AI to enhance both detection and prevention, using machine learning algorithms that analyse data in real time

to block threats before they cause harm. For instance, supervised learning allows us to recognize known threats, such as malware, by detecting their unique signatures. Unsupervised learning takes it a step further, identifying emerging threats by spotting abnormal patterns that don't have known signatures. We also use AI-powered user behaviour analytics to monitor for suspicious activity that could indicate compromised accounts.

When it comes to personal devices, AI plays a key role in boosting endpoint security – whether it's identifying vulnerabilities, detecting malware, or preventing unauthorised data transfers.
