

Sony Bravia 7 65-Inch Mini LED TV

Premium Experience at a Competitive Price?

₹1,71,990

W

hen it comes to picking a premium TV,

buyers are often torn between the allure of OLED and the dependability of Mini LED TVs. While white OLEDs and QD-OLEDs are known for their deep blacks and excellent contrast, their high price point makes them a stretch for many, especially when you are considering a 65-inch or larger size. That's where the Sony Bravia 7 Mini LED TV steps in, offering a more accessible, high-quality alternative. Sony is betting big on Mini LED TVs as its flagship technology for the future. The combination of the mini LED display with quantum dots enhancements and Sony's image processing is a very alluring option for those seeking a flagship-level experience in larger screen sizes. Does it deliver? Let's answer all your questions related to the Sony Bravia 7 Mini LED TV in this review, starting with the specifications.

DESIGN AND BUILD

The Sony Bravia 7 K-65XR70 has a very premium design and feels quite substantial. There are no distractions on the front - the bezels are extremely narrow on three sides and even the brushed metal bottom bezel is sans any branding. The back

of the TV also has a clean look, with Sony's signature checkerboard pattern. The TV doesn't ship with a stand in the box. After purchase, you can request a table-top installation for Rs. 2500 or a wall-mount installation for Rs. 1000. The metallic tabletop stand that we opted for feels very premium and is also height-adjustable. The power chord has a tie for power cable management.

Ports are side-facing and easily accessible. Out of 4 HDMI ports, you can access full HDMI 2.1 bandwidth on two ports due to the limitations of the MediaTek chipset. One of these two can be used for eARC output to external sound systems. While LG and Samsung

offer four HDMI 2.1 ports in comparable models, two should meet the needs of most users. Personally, I've never found a need for more than two HDMI 2.1 ports.

Sony's eco remote is made of flame retardant and recycled Sorplas plastic. It's an ergonomic remote that is comfortable to hold and operate and has all the necessary buttons.

DISPLAY QUALITY

Our review sample employs a good-quality VA LCD panel. On a 10% Window, the Bravia 7 can get almost 2000 nits bright, even in the Professional mode with an accurate white point! This enables the TV to deliver impactful HDR.

We couldn't measure the native contrast of this TV because, even when local dimming is turned off, it doesn't seem to fully deactivate. This limitation affects the accuracy of our contrast measurement with our equipment.

Gamut's coverage is also impressive. The panel can reproduce almost 100% of Rec. 709 colour space used for SDR content. As for HDR, the Bravia 7 supports 97% DCI-P3 coverage and 79% of BT2020 coverage in UV terms.

One of the most impressive features is how Sony handles the mini LED backlight and the local dimming to enhance contrast while minimising dimming-related artefacts like halos and blooming. The LED LCD panel is reflective, but that also helps a sense of depth if you are watching in a relatively dark ambience (as is recommended for HDR).

The color volume measures the range of colors a TV can produce at different brightness levels. The color volume we measured exceeded our expectations for an LED LCD panel. The TV can reproduce 100% of Rec. 709 and nearly 90% of the DCI-P3 color volume.

We did notice a slight loss of luminance and shifting of colours off-axis. While this is common for affordable VA panels, wider viewing angles are expected in the premium segment.

SDR AND HDR

We tested the colour accuracy of the
