

cores and instead of 24 Threads, it gets 20. The boost clock between these chips is 5.0GHz and 5.1GHz for the HX 370 and HX 365, respectively. However, both chips have the same power draw range between 15-54W.

Also, the HX 370 I tested was in a 16-inch ASUS Zephyrus G16 but the HX 365 in the ASUS ProArt PX 13 has relatively smaller breathing room in a 13-inch chassis. Also the former gets 3-fans inside the chassis but the PX 13 has only two. Now, first up in Cinebench R23, I clearly see a good difference between the two CPUs, with HX 370 scoring 23134 in multicore and 2026 in single-core tests. Meanwhile, the HX 365 scored 20078 and 1938 in single and multicore tests.

A similar trend appears in the Cinebench R20 test, where the HX 370 scores 8739 in multicore and 796 in single-core tests, while the HX 365 achieves 7884 and 759 in multi-core and single-core tests, respectively. In the Cinebench R15 OpenGL graphics test, the HX 370 scored 250 while the HX 365 scored 251, indicating that despite differences in core counts, number of threads, and core clock, the iGPU performance is similar in both chips.

Speaking of graphics performance, as I mentioned, the ProArt PX 13 comes with Nvidia GeForce RTX 4050 Studio version. But despite that, it is a much more powerful 95W TGP variant. However, it is still not as powerful as an RTX 4050 in a full-fledged gaming laptop like the Gigabyte G6X. But it is still more powerful than the RTX 4050 something like an MSI Cyborg. In 3DMark TimeSpy and FireStrike, the PX 13 with the RTX 4050 scored 7789 and 19606, while the G6X with the same GPU achieved 8813 and 20933. The RTX 4050 in the MSI Cyborg scored around 6874 and 15692 in these tests, respectively.

In terms of thermal performance, the 13-inch chassis performs well. Under normal use cases, the maximum CPU temperature reaches only around 48 degrees. While gaming, the CPU core temperature reaches close to 78 degrees, and under CPU-specific load, the temperature can soar up to 95 degrees.

The highest surface temperature reaches 41.2°C, located above the function

row at the top edge of the keyboard, while the W, A, S, D key area, the middle, and the right side of the keyboard remain relatively cooler. Specifically, the left side stays at 29.1°C, the middle section reaches 37.0°C, and the right end remains the coolest at 27.9°C. In terms of fan noise, the fans peak at 34.5 dB, drop as low as 27.7 dB, and average around 31.1 dB, balancing both light and heavy workloads.

The 1TB SSD in the ProArt PX 13 is a PCIe Gen 4 unit that performs solidly compared to SSDs in other creator laptops, placing it right in the middle. It outpaces the Zephyrus G16 in both read and write speeds, with the PX 13 achieving a sequential read of 5278.03 MB/s and a write speed of 3754.56 MB/s, compared to the Zephyrus G16's 5069.44 MB/s read and 2314.6 MB/s write speeds. However, it falls short of the Dell XPS 16, which reaches 7079.26 MB/s in read speeds but lags in write speed with 1554.83 MB/s.

The ASUS ProArt PX 13, equipped with a 73Wh battery, offers a range of battery life depending on usage. For general tasks like web browsing and document editing, it typically lasts around 5 hours and 9 minutes. When streaming 1080p content at full brightness, the battery holds up for approximately 6 hours and 40 minutes, but this drops to just over 3 hours and 15 minutes for 4K streaming. During continuous web browsing, the laptop manages about 9 hours and 20 minutes. Overall, while the ProArt PX 13 provides reasonable battery life for everyday tasks, high-resolution streaming or intensive creative work significantly reduces its endurance.

VERDICT

The ASUS ProArt PX 13 is a compact powerhouse tailored for creative professionals who need a balance of portability and performance. Its standout features include a vibrant 13.3-inch OLED display, precise colour accuracy, and a sturdy build with a 360-degree hinge, making it versatile for various work settings. The laptop packs an AMD Ryzen AI 9 HX 365 CPU and NVIDIA GeForce RTX 4050 Studio GPU, which perform admirably for content creation tasks but fall short for

high-intensity gaming, especially with its 60Hz display. Its 1TB PCIe Gen 4 SSD offers fast read and write speeds, placing it between competing models like the Zephyrus G16 and Dell XPS 16.

However, the laptop's limitations are noticeable. The 380-nit display brightness, while stunning indoors, struggles in outdoor lighting. The 13-inch chassis keeps thermals under control but can get warm under heavy loads, peaking at 41.2°C above the function row. Additionally, the speakers are decent but may disappoint users seeking high-fidelity sound due to their limited sound stage and bass.

At ₹179,990, the ProArt PX 13 is ideal for creative professionals who need a portable, colour-accurate laptop for design and editing. It's a great option for those seeking a powerful yet compact device for on-the-go work. However, gamers or users needing extended battery life for high-resolution video playback or intensive workloads may not find suitable alternatives in this form factor. If you're open to a slightly larger option, the Zephyrus G16 2024 offers excellent performance for both gaming and creative tasks.
