

- **AnTuTu 8.0:** 2,364,740
- **Geekbench 5 Single Core:** 2,797
- **Geekbench 5 Multi-Core:** 8,433
- **3DMark Wildlife Extreme:** 6,500

These scores comfortably place it among the top-performing smartphones in its segment. The PCMark Work 2.0 score of 12,579 further doubles down on how capable this phone is when stressed to its max. Real-world performance mirrors these numbers. Multitasking with multiple heavy apps, editing photos, and running graphically intensive games like Genshin Impact and Call of Duty: Mobile posed no issues. The 80 per cent stability in the CPU throttling test over 15 minutes indicates consistent performance without overheating. Job well done, Oppo.

CAMERAS

Let me break down each of the three camera's performance for you in two simple sections –

Daylight photography

The telephoto camera is the star of the show here. It captures great details, retains colours well, and the overall look and feel of the pictures are fairly true to life. The pictures do take a moment to get refined after you are done shooting, and that is the case with all three cameras here. However, once the phone is done working its processing magic, the images do come out looking fairly detailed, and crisp. You can see the camera samples below, and you can be the judge for yourself. But, I would like to highlight one quailm that I had with the phone's photo processing – It tends to overexpose images when left untouched. Smartphone cameras are meant to be a one-click tool for most folks. The professionals already carry their fancy ICL cameras to take great pictures after dialling in each setting. The regular consumer needs a great picture at the click of a button. Not to bring down the overall capability of the camera setup, which clicked great shots once I dialled in the exposure, but the single-click performance of the phone's cameras was honestly a letdown, which I hope Oppo will fix soon as from what

I gather, it has more to do with the software than anything else.

Nighttime photography

This is another key area, where the phone does really well for the most part. Once the exposure is dialled in, you are looking at some stunning shots with great colour retention, overall crispness, and edge detection. However, as the day got darker, the AI-assisted photography did start to show its flaws. If you pixel peep into the camera samples, in extremely challenging shots, with a lot of complexity in the subjects, you will see edge smoothening and artefacting, which is not ideal. As soon as there was enough light for the sensor to capture, the pictures came out looking great, but when the sun went down, there were a few misses, which I am sure the brand would keenly look to fix. I won't dive much into my observations about the camera. It is you the consumer who has to take call on how you like the pictures and whether you like them coming from this phone or not. You can check out the samples on Digit.in.

Selfies

The selfies on this phone came out looking great no matter the lighting conditions. Be it after dark at a party, or on a bright sunny beach, you will get great pictures on this phone.

Video capabilities are equally impressive, with 4K 60fps Dolby Vision HDR recording supported across all cameras, including the selfie shooter. I did shoot quite a few clips on the streets of Bali, and was impressed with the phone's video capabilities. Complimenting the great video setup is the microphone array, which also ensures that your piece to the cameras or the ambient sounds which would add a significant amount of character to the videos, are captured well on this device.

BATTERY

The 5630mAh silicon-carbon battery offers above-average endurance. In our tests, it achieved a respectable 20 hours and 13 minutes on PCMark, aligning or even surpassing the expectations for a

flagship in this category. However, real-world usage paints a mixed picture:

- **1 hour of GPS navigation:** 5% battery drop.
- **30 minutes of Netflix streaming:** 4%.
- **15 minutes of gaming (Call of Duty: Mobile):** 7%.

While sufficient for a day and a half's use, power users might need to recharge sooner. Thankfully, Oppo's 80W SUPERVOOC charging fills the battery from 0 to 100 per cent in just about an hour in my tests, while 50W AIRVOOC wireless charging adds convenience for users on the go.

VERDICT

The Oppo Find X8 ticks a lot of the right boxes for a flagship. Features like AI-enhanced photography, super-fast charging, and smooth multitasking make it a compelling choice for everyday users and tech enthusiasts alike.

That said, it's not without its flaws. The pre-installed bloatware in ColorOS 15 can feel unnecessary and clutter the otherwise polished experience. The low light camera performance, while excellent when dialled in with the perfect settings, doesn't set any new standards, and while the rest of the capabilities are versatile, they don't leapfrog the competition in this segment. If you're after a phone that balances strong hardware with useful AI-driven features—and can look past a few quirks—the Find X8 is a solid pick. It's not the flashiest flagship out there, but it delivers where it counts for most users.
