

01

AI AGENTS ARE COMING

In an interview with MIT Technology Review, OpenAI's Sam Altman described the best application of AI as a "super-competent colleague that knows absolutely everything about my whole life, every email, every conversation I've ever had, but doesn't feel like an extension." That's what an AI agent will look like, in essence. Are you ready for J.A.R.V.I.S., Tony Stark's intelligent AI assistant from Iron Man, or Samantha from Her, a significantly advanced AI operating system than what we've experienced till now?

Simply put, an AI agent is a slightly more advanced AI program that can perform certain autonomous tasks that aren't just limited to its own base program. ChatGPT or Gemini can write code for you, if you ask for it, but it can't go and create a website or an app from that code, where the website is live with a domain name or the app published on the app store. An AI agent will be able to do these things – I'm not saying these exact tasks that I suggested above, but these AI agents will have the ability to not just show what needs to be done but also

go ahead and do some of that work. All the big movers and shakers of the AI industry are planning to release their version of AI agents for the public very soon in 2025. OpenAI's reportedly working on getting their AI agent, codenamed Operator, out into the open for everyone to check out by January 2025. The AI agent is expected to be capable of autonomously operating certain tasks within your computer, like booking flight tickets and implementing code, among other things. Google seems to be working on several AI agent projects, one of which is known as Project Jarvis, which recently leaked on the Chrome Web Store. This AI agent will supposedly

reside within Google Chrome browser, with the ability to not only automate and execute tasks within the browser but also operate other apps on the host PC or computer. While there's no set release date for Project Jarvis yet, however, Google's Gemini 2.0 AI model is expected to have AI agents built-in to offer enhanced capabilities – it's expected to release later this year in 2024. Microsoft is also working aggressively on AI agents, something that it had announced earlier in the year in 2024. According to its official blog, new capabilities in Copilot Studio will allow Microsoft customers to create powerful autonomous AI agents. Some of these demonstrations are in public preview at the moment, where AI agents can draw upon work or business data from different Microsoft Office 365 apps.

Anthropic, an AI startup competing with OpenAI, has already released its AI agent for people to try. According to Techcrunch, Anthropic has made significant upgrades to its Claude 3.5 Sonnet AI model which now lets it use the host computer – yes, it can interact with computers in a way that mimics humans. It can move the cursor around the screen, click on apps and buttons, and it can potentially interact with other softwares and programs installed in your PC to autonomously execute various tasks. How scary and cool is that?!

On-device AI refers to artificial intelligence models that run directly on your device (like your smartphone, tablet, or laptop) rather than relying on remote servers. This means tasks are processed locally, offering several advantages: speed of AI execution which can operate completely offline and thereby enhance data privacy. Everything from smarter assistants on smartphones, real-time language translation in speech, and more capable AI applications with enhanced local device context is going to appear on everything from smartphones to
