

Snapdragon 8 Elite

Qualcomm's new powerhouse AI mobile chip decoded

Jayesh Shinde | jayesh@digit.in

In the ever-evolving landscape of mobile technology, the race for superior performance and efficiency is relentless. Qualcomm has just thrown down the gauntlet with the unveiling of its latest flagship chipset, the Snapdragon 8 Elite. Poised to power the crème de la crème of Android smartphones from late 2024 through most of 2025, this chip represents significant gains in mobile processing, artificial intelligence, GenAI, gaming, and connectivity.

As we delve into what makes the Snapdragon 8 Elite a game-changer, it's clear that Qualcomm isn't just aiming to keep pace with the competition – they're intent on redefining the boundaries of what's possible in mobile computing. So let's see what all the fuss is about, shall we?

It's all about the Qualcomm Oryon CPU

At the core of the Snapdragon 8 Elite lies the brand-new, second-generation

Qualcomm Oryon CPU. This isn't just an incremental upgrade, according to Qualcomm – it's a complete architectural overhaul designed from the ground up to deliver unprecedented power and efficiency. Clocking in at a staggering peak speed of 4.32 GHz, Qualcomm touts it as the fastest mobile CPU in the world.

But raw speed is just part of the story. The Oryon CPU boasts a 45% boost in performance over its predecessor, while also achieving a 44% improvement in power efficiency. This means users can expect lightning-fast multitasking, smoother browsing, and seamless transitions between apps — all without draining the battery, which is very important from any user's perspective. In fact, the chip delivers up to 27% in overall power savings, potentially extending gaming sessions by up to 2.5 hours, according to Qualcomm.

A significant contributor to this performance leap is the industry's largest shared cache in a mobile processor. With a massive 24MB of L2 cache — split evenly between performance and efficiency cores — the CPU can access
