

of that," said a spokesperson for the tech giant, according to a report by Futurism. "This response violated our policies and we've taken action to prevent similar outputs from occurring."

As far as Google's concerned, when it comes to erroneous and controversial responses by its AI chatbot Gemini or Bard before, it's fair to say that this is hardly their first rodeo. Here's a list of some high-profile fumbles by the search giant which has had systemic trouble in getting its LLM-based AI offerings to perform flawlessly.

1) Gemini creates wrong, racist, sexist historical images

Earlier this year in February 2024, when Google Gemini unwrapped its AI image generation capability, it almost immediately came under fire for producing racist, offensive and historically incorrect image results. You see, in an attempt to promote diversity (without any guardrails), Gemini generated historically inaccurate images, such as: Black individuals as Founding Fathers of the United States of America (they were all White). A woman as the Pope (there has been no female Pope so far). Not just fumbling at inclusivity, Gemini also produced insensitive images, including: A person of colour as a Nazi soldier (an oxymoron at best).

These are just a few examples, as the controversy surrounding Gemini involved a wider range of problematic outputs not just limited to text-to-

image, prompting Elon Musk to label Google Gemini "super racist and sexist!"

2) UNESCO calls out Google AI for 'false' history

In June 2024, a UNESCO report expressed warnings over the likes of Google Bard (predecessor of Gemini) and OpenAI's ChatGPT creating 'false' content about World War II events and the Holocaust, thanks to the hallucinative nature of AI-generated content. The UNESCO report points out that AI chatbots, like ChatGPT and Google Bard, have been shown to generate harmful misinformation about the Holocaust. These AI models have produced fabricated accounts, such as the non-existent 'Holocaust by drowning' campaigns, and false witness testimonies.

UNESCO strongly urged the emphasis on ethical use of AI technologies to ensure the memories of World War II and Holocaust are preserved in their true form for younger and future generations.

3) Google Bard and Gemini mess up during live demo

During its very first demonstration in February 2023, the then Google Bard fumbled badly by providing incorrect information about the James Webb Space Telescope's discoveries, leading to a \$100 billion drop in Alphabet's market value. A super costly mistake for what was supposed to be Google's very first public response to ChatGPT at the time and it messed up extremely badly,

seemingly to never recover from the mishaps that followed – which show no signs of stopping. More recently this year, at the Google I/O conference in May 2024, Gemini's video search feature again made unforgivable factual errors during a live demonstration, according to a report by The Verge, raising concerns about the reliability of Google's AI chatbot.

Apart from these high-profile AI controversies, Google also found itself in the middle of a major viewer backlash against its Gemini ads for Paris 2024 Olympics, where the Gemini AI chatbot sparked outrage in an ad that showed a father using Gemini to help his daughter write a fan letter to Olympian Sydney McLaughlin-Levrone. While Google defended the ad, the backlash against it highlighted concerns about the potential negative impacts of AI on human creativity – especially in young children. Then there was also that instance in May 2024 when Google's AI-generated summaries in search results, known as AI Overviews, contained errors like suggesting users add glue to pizza recipes or eat rocks, prompting Google to scale back the feature.

Well, there's nothing much to say here apart from the fact that it's high time for Google to get its Gemini and other AI-related acts together. As much as I don't want to think about the scary reality of rogue AI, it's getting embarrassing at this point for Google to constantly keep fumbling on the AI front. ❌
