

How to use WhatsApp's low-light mode for better video calls?

Team Digit | editor@digit.in

WhatsApp has come a long way from being just a messaging app. With regular updates and new features, it has become a key app for staying connected with loved ones. If you frequently video call friends and family on WhatsApp, you'll be happy to know about the recently launched low-light mode. This feature aims to enhance video call quality even in dim lighting, helping you connect more clearly, no matter the setting.

Want to give it a try? Here's a step-by-step guide to using low-light mode for better video quality on WhatsApp calls.

How to use low-light mode on WhatsApp

- **Step 1:** Open WhatsApp on your phone
- **Step 2:** Start a video call with any of your friends or family member
- **Step 3:** On your screen, you'll see a bulb icon on the top-right.
- **Step 4:** Tap on the bulb icon to turn it on. To turn it off, just tap on the "Bulb" icon again.

And now your friends and family can see you clearly with better visibility and reduced graininess regardless of the lighting condition you are in. Currently, this feature can be accessed only on Android and iOS, not on Windows.

Things you should know

As this is a temporary setting, this needs to be activated every time while you are on call.

Apart from the low-light mode, WhatsApp has some more interesting video call features such as background remover, filters and touch-up.

- **Background remover:** Using the background remover feature, you can change your background during video calls.
- **Filters:** Using this feature you can add a filter among many while having the video call with your friends and family, which can make your video calls more lively.
- **Touch-up:** WhatsApp also allows you to give you a basic touch-up while you are on video call.
